Technical Features

Variable displacement, axial piston pumps for open circuit hydraulic systems
 Available as standard (P2) or supercharged (P3) version
 Optimized for mobile applications:

- Dedicated envelope design and unique port layout
- High self-priming speed
- Standard integrated pre-compression volume
- Heavy duty approval (size 105 and 145) for increased power density

Customer Benefits

- Cost saving installation by direct PTO mount
- High productivity by maximized output flow
- High altitude operation capability
- Low noise level and reduced flow ripple

P2 Series

P3 Series

TB	Torque control, load sensing with bleed-off orifice and max. pressure control, range 20...60% of reference torque value
TC	Torque control, load sensing w/o bleed-off orifice and max. pressure control, range 50...90 % of reference torque value
TD	Torque control, load sensing with bleed-off orifice and max. pressure control, range 50...90 % of reference torque value

Pressure control

The pressure control is used to limit the maximum system pressure. The control acts such that full pump displacement is achieved unless the load pressure reaches the maximum setting of the control. If pump flow is restricted by the system valve, the pump will provide only the flow demanded, but at the maximum pressure setting of the compensator control. If the outlet flow is completely blocked, the pump will de-stroke to zero displacement and maintain the pressure at the setting of the compensator spring.

Response times of the pump are collected from a circuit as below by measuring the pumps swash angle movement at different pressures.

	Size 60 and 75 100 ... 320 bar
Hysteresis and repetitive accuracy	max. 3 bar

* Curve shown exaggerated

Remote pressure control

This control allows the pump pressure compensator setting to be adjusted from a remote relief valve. The control acts such that when full pump displacement is achieved the load pressure reaches the maximum setting of the remote relief valve. If pump flow is restricted by the system valve, the pump will provide only the flow demanded, but at the maximum pressure setting of the compensator control. If the outlet flow is completely blocked, the pump will de-stroke to zero displacement and maintain the pressure at the setting of the remote relief valve.

Response times of the pump are collected from a circuit as below by measuring the pumps swash angle movement at different pressures.

Load sensing control with maximum pressure control

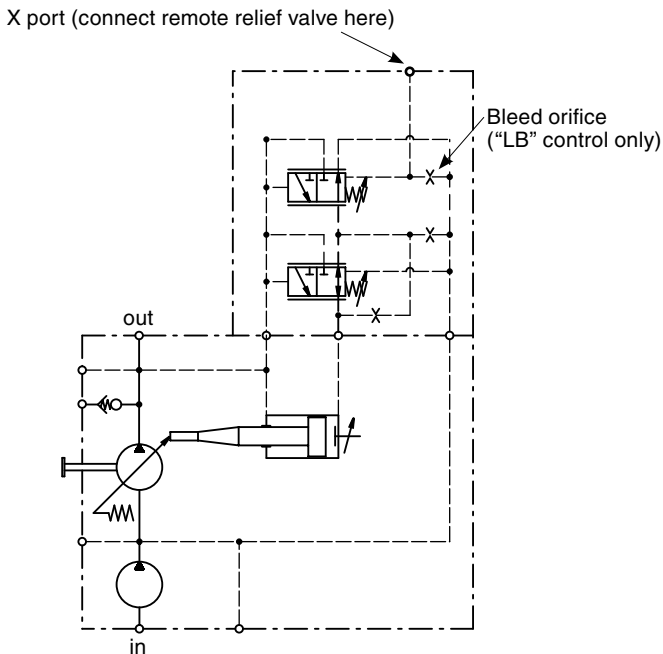

These controls feature load sensing and maximum pressure compensation. Load sense controls are used to match pump flow to system demands.

Response times of the pump are collected from a circuit as below by measuring the pumps swash angle movement at different pressures.

P2 Control schematics

P3 Control schematics

Hysteresis and repetitive accuracy	max. 3 bar

* Curve shown exaggerated

Differential setting vs. stand-by pressure

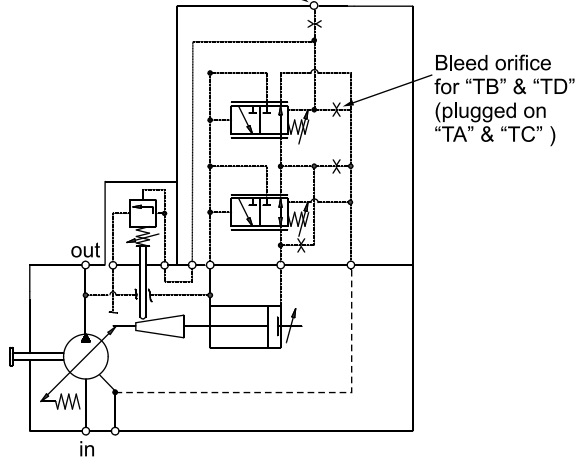

Torque limiting control with load sensing and maximum pressure control limiter

These controls provide the benefits of the load sensing and pressure limiting controls, plus the ability to limit the input torque the pump will draw. These controls are beneficial when the power available from the prime mover for the hydraulics is limited or the application power demand has both high flow/low pressure and low flow/high pressure duty cycles.

P3105 - 20...60 % Torque (1800 rpm)

P3105 - 50...90 % Torque (1800 rpm)

P3145 - 20...60 % Torque (1800 rpm)

P3145 - 50...90 % Torque (1800 rpm)

Fluid: Mineral oil ISO VG 32 at 40°C ; Inlet pressure: 1.0 bar (absolute) measured at inlet port.

Ripple chamber

Pressure ripple at 200 bar

The chart on the right refers to the “Ripple Chamber” technology engineered into the P2 and P3 series pumps. The ripple chamber reduces flow pulsation and due to this pressure pulsation (called “ripple”) at the outlet of the pump. This technology reduces the ripple by 40–60%. This leads to a significant reduction in overall system noise without additional components or cost.

The ripple chamber is standard on all P2 and P3 series side ported pumps.

B	69	69

Multiple pump combinations - Maximum moment

To avoid excessive front flange loads combinations of multiple pumps might require additional pump support.

Chart 1. Maximum moment and pump dimensions

		P2060	P2075	P2105	P2145
Maximum Moment	[Nm]	197	266	425	556
Weight	[N]	358	431	618	805
Distance L1	[mm to C/G]	126	145	165	158
Distance Lp	[mm]	264	292	323	329

Chart 2. Through drive adapter plate thickness

LF		P2060	P2075	P2105	P2145
SAE - A Flange	[mm]	0	0	0	0
SAE - B Flange	[mm]	33	33	33	33
SAE - C Flange	[mm]	35	35	35	35
SAE - D Flange	[mm]	–	–	–	45.5

Resulting moment can be calculated by using the following formula:

$$\text{Moment } M = (L1*W1+L2*W2+L3*W3+...)$$

If resulting moment exceeds the maximum value given in chart 1 additional support is mandatory.

Multiple pump combinations - Maximum thru drive torque

		P2060	P2075	P2105/ P3105	P2145/ P3145
Torque	[Nm]	339	424	650	897

Fluid recommendations

- Normal mineral oil
- Premium hydraulic fluid / HLP oil
- Bio-degradable hydraulic fluid
- Synthetic hydraulic fluid
- Fire resistant fluids, water based fluids (HFC)

Note: Maximum system pressure reduced to 210bar for water based fluids. Bearing life time reduced to 25% by using water based fluids.

Viscosity

Min. viscosity for short periods:	10 mm ² /s (cSt)
Normal operating viscosity:	15...40 mm ² /s (cSt)
Max. viscosity for short periods:	1000 mm ² /s (cSt)

Filtration

For maximum pump and system component functionability and life, the system should be protected from contamination by effective filtration.

Fluid cleanliness should be in accordance with ISO classification ISO 4406. The quality of filter elements should be in accordance with ISO standards.

Recommendation for filtration:

Class 21/18/14, according to ISO 4406

Seals

Check hydraulic fluid specification for chemical resistance of seal material.

Check temperature range of seal material and compare with max. system and ambient temperature.

N/D - NBR seals, FPM shaft seal(s) -25 ... +90 °C

B/Q - NBR seals, NBR shaft seal(s) -40 ... +90 °C

V/T - FPM seals, FPM shaft seal(s) -25 ... +115 °C

Note: Above limitations refer to average case drain temperature, which can be up to 20 °C higher than in the reservoir.

Axial / Radial Loads

Units subjected to radial loads require the installation of an outboard bearing. Axial Loads are not permitted.
